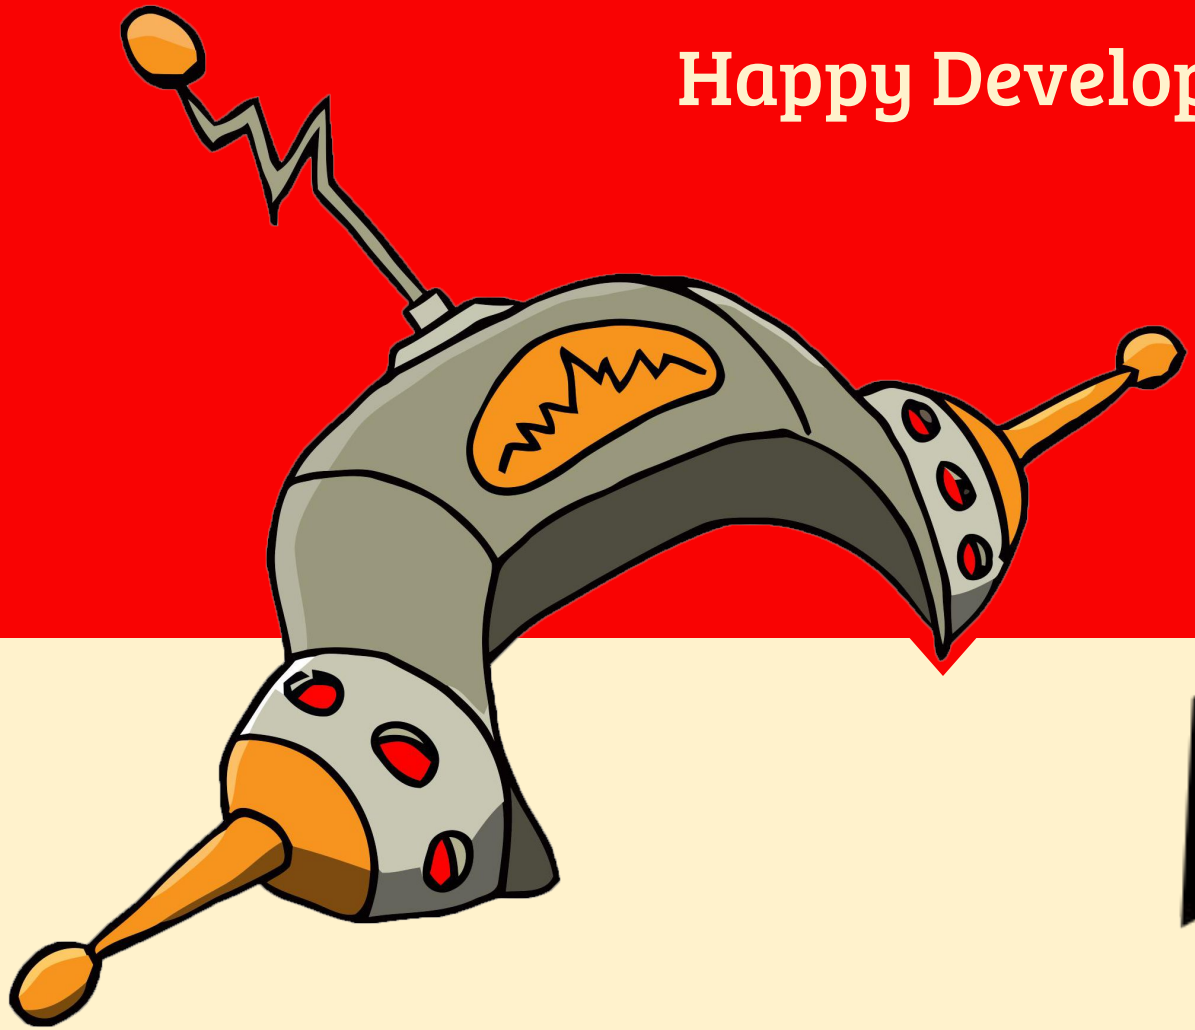
Happy Development with Hapi.js



hapi

October, 2017

Recipe for Hapiness

1. When node hapi, learn Node.js
2. Try other frameworks and struggle with them a lot
3. Run

```
$ npm install -g makemehapi

$ makemehapi
```

- Node.js Technology Discovery
- Node.js, Linux & Emacs Evangelist
- Experience with Node.js Frameworks
- Projects, written in Hapi.js

How (Agenda)

— — —

1. Introduction
2. Getting Started (basic server, routing, serving static content)
3. Response & Error Handling with Boom()
4. Validation with Joi
5. Plugins - The ❤️ of Hapi
6. Opinionated by Glue
7. Quality Code, Security & Testing
8. Demo & Resources

Hapi is...

- ➔ Configuration > Code
- ➔ Feature Rich
- ➔ Reusable
- ➔ Secure
- ➔ Scalable
- ➔ Production ready
- ➔ ... just Awesome

Introducing Hapi

– – –

★ History

- 2011, Walmart Labs

- Black Friday Success

★ Contributors

- Eran Hammer

★ Community

Hapi.Server()

```
'use strict';

const Hapi = require('hapi');
const server = new Hapi.Server();

server.connection({ port: 3000, host: 'localhost' });

server.start(err => {

  if (err) {
    throw err;
  }

  console.log(`Server running at: ${server.info.uri}`);
});

```

Example

```
'use strict';

const Hapi = require('hapi');
const server = new Hapi.Server();

server.connection([
  { port: 3000, host: 'localhost' },
  { port: 8080, host: 'localhost', labels: ['api'] }
]);

server.start(err => {
  if (err) throw err;

  server.connections.forEach(connection => {
    console.log(`server is listening on ${connection.info.uri}`);
  });
});
```

Example

Hello World!

```
3  | const Hapi = require('hapi');
4  | const server = new Hapi.Server();
5  |
6  | server.connection({ port: 3000, host: 'localhost' });
7  |
8  | server.route({
9  |   method: 'GET',
10 |   path: '/',
11 |   handler: function (request, reply) {
12 |     reply('Hello World!');
13 |   }
14 | });
15 |
16 | server.start(err => {
17 |   if (err) throw err;
18 |   console.log(`Server running at: ${server.info.uri}`);
19 | });
```

Example

```
6  | server.route({ method: ['PUT', 'POST'], path: '/user', handler: ...});
7  |
8  | server.route({ method: 'GET', path: '/hello/{user}', handler: hello});
9  | server.route({ method: 'GET', path: '/hello/{user?}', handler: hello});
10 |
11 | function hello(request, reply) {
12 |   reply(`<h1>Hello, ${request.params.user}!</h1>`);
13 | }
14 |
15 | server.route({
16 |   method: 'GET',
17 |   path: '/hello/{user*2}',
18 |   handler: function(request, reply) {
19 |     const userParts = request.params.user.split('/');
20 |     reply(`Heey, ${userParts[0]}, ${userParts[1]}!`);
21 |   }
22 | });
```

Example

```
8  | const api = server.select('api');
9  |
10 | api.route({
11 |   method: 'GET',
12 |   path: '/',
13 |   handler: function(request, reply) {
14 |     reply(`API index`);
15 |   }
16 | });
17 |
18 | // all servers with a label of backend OR api
19 | const myServers = server.select(['backend', 'api']);
20 |
21 | // servers with a label of api AND admin
22 | const myServers = server.select('api').select('admin');
23 |
24 |
```

Hapi Plugins

1. How to write a plugin
   - structure (server, options, next)
   - register method & attributes
   - internal vs external

2. How to load the plugin
   - external / internal
   - one by one / multiple
   - pass options
   - select a connection

```
3  const myPlugin = {
4    register: function (server, options, next) {
5
6
7      // Do something
8
9
10     next();
11   }
12 };
13
14 myPlugin.register.attributes = {
15   name: 'myPlugin',
16   version: '1.0.0',
17   multiple: false
18 };
```

Example

```
3  const myPlugin = {
4    register: function (server, options, next) {
5
6      server.route({
7        method: 'GET',
8        path: '/doSomething',
9        handler: function (request, reply) {
10         reply.success();
11       }
12     });
13
14     next();
15   }
16 };
17
18 myPlugin.register.attributes = { name: 'myPlugin', version: '1.0.0' };
```

Example

```
// load one plugin
server.register(require('myPlugin'), (err) => {
  if (err) {
    console.error('Failed to load plugin:', err);
  }
});

// pass options
server.register({
  register: require('myPlugin'),
  routes: { prefix: '/plugins' },
  options: {
    secret: process.env.SECRET
  }
}, (err) => {
    if (err) throw err;
});
```

Example

```
// load multiple plugins
server.register([require('myPlugin'), require('yourPlugin')], (err) => {
  if (err) {
    console.error('Failed to load plugin:', err);
  }
});

// pass options
server.register({
  register: require('myPlugin'),
  routes: { prefix: '/plugins' },
  options: {
    secret: process.env.SECRET
  }
}, (err) => {
    if (err) throw err;
});
```

Example

Glue your plugins

Server composer for Hapi

- `server = new Hapi.Server(options)`
- one or more `server.connection(options)`
- one or more `server.register(plugin, options)`

Hapi Serving

Serving Static Content

1. Don’t use Hapi for that.
2. Inert plugin
3. File Handler => reply.file();
4. Directory Handler

Set your Vision

1. Supported Template Engines? Any!
2. Vision Plugin Configuration & API

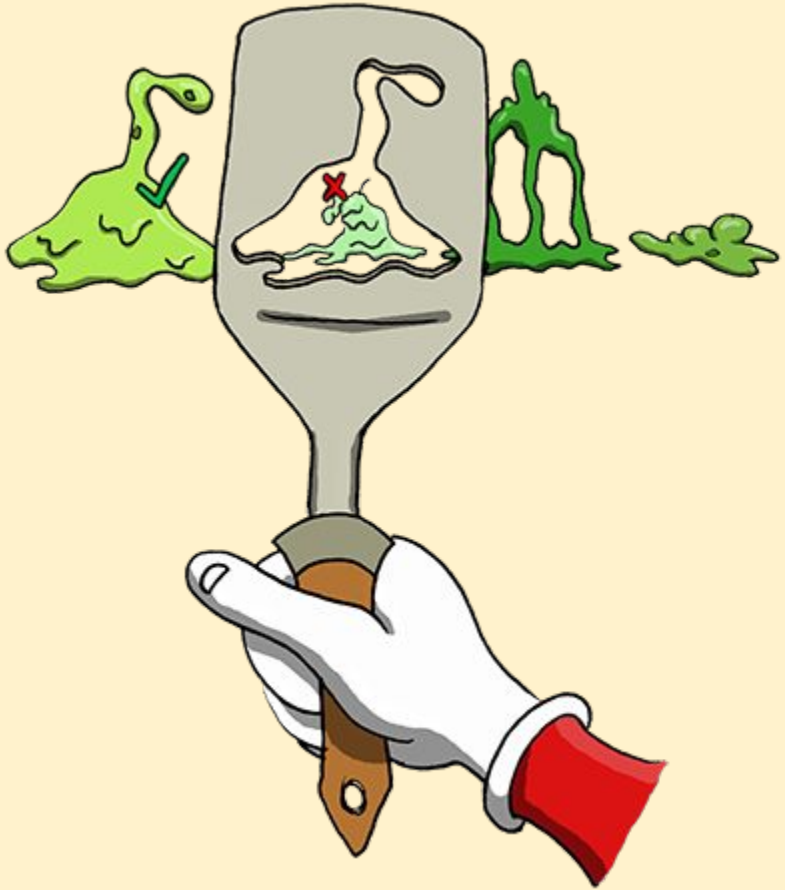
> Example code from MentorMate OrgChart - Hapi Version PoC

Route Back

The joi of reusable validation

— — —

1. Trivial yet important for every API
2. Validating hapi routes with joi
   - Example code from Hapi API Boilerplate
3. Validation model schemas and ...everything
   - Example code from Hapi API Boilerplate
4. Documentation generation (wow!)
   - Demo with Swagger /documentation



From the Lab to Prod

— — —

1. Borrowed heavily from mocha
2. Lab.js & Code
   - Writing tests
   - Code coverage
   - Linting
   - Reporters
3. Testing hapi applications with lab
4. Continuous Integration Setup

DEMO

The Stack

Node.js - v8.x.x
Hapi.js + cool plugins
Redis
MongoDB / PostgreSQL
GitLab-CI with Docker
Swagger UI
